

Care Instructions

SUCCULENT PUMPKIN

- **Light:** Place your succulent pumpkin in a location with bright, indirect sunlight. Succulents thrive in well-lit environments, but direct sunlight can cause the pumpkin to decay faster.
- **Watering:** Succulents need minimal water. Lightly mist the succulents once a week to keep them hydrated. Avoid watering the pumpkin itself, as excess moisture can cause it to rot.
- **Temperature:** Keep your succulent pumpkin in a cool, dry place. Avoid placing it near heat sources or in areas with high humidity, as this can accelerate the decomposition of the pumpkin.
- **Lifespan:** With proper care, your succulent pumpkin can last for several weeks. As the pumpkin naturally starts to soften or decay, you can transfer the succulents to a new pot with well-draining soil to continue growing.
- **Maintenance:** If any of the succulent leaves begin to wilt or shrivel, gently remove them to keep the arrangement looking its best. You can also trim back any overgrown succulents to maintain the shape and appearance.
- **After the Season:** Once the pumpkin has reached the end of its lifespan, carefully remove the succulents and plant them in a container with cactus soil to enjoy them for years to come.
